## Slopes

What is the acceleration of an object without friction on a slope of a particular angle?

What is the force required to pull a block up/down that slope including friction?

$F_{\parallel}$

the component of the weight (force

$F_{g\perp}$

the component of the weight (force of gravity) perpendicular to the surface.

$$F_{g\perp} = F_g \cos \theta$$

$F_{g\parallel}$  is the parallel component of  $F_g$ .

$$F_{g\parallel} = F_g \sin \theta$$

$F_{g\perp} = F_N$  if there are no other forces or acceleration  $\perp$  to slope

$$F_f = \mu F_N = \mu F_{g\perp} = \boxed{\mu F_g \cos \theta}$$

1. A 2.0 kg cart is rolling down a 30.0 degree

slope. determine

- a) the weight of the cart
  - b) the component of the weight parallel to the surface
  - c) the acceleration of the cart if friction is negligible.
2. You pull a 2.5 N wooden block up the 30.0 degree incline.
- a) what is the normal force of the block on the slope?
  - b) what is the force of friction if the coefficient is 0.20?
  - c) What is the force required to pull up the block?
  - d) how about pulling it down the slope?
3. You connect the block from question 2 over a pulley to a 300 g hanging mass, what is the acceleration of the system?

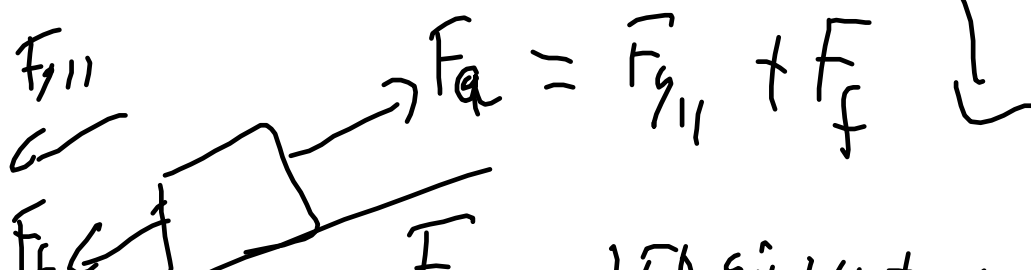

a)  $F_g = mg = 2.0 \text{ kg} \times 9.8 \text{ N/kg} = 19.6 \text{ N} = 2.0 \times 10^1 \text{ N}$

b)  $F_{g \text{ parallel}} = F_g \sin \theta = 19.6 \text{ N} \sin 30 = 9.8 \text{ N}$

c)  $a = F_{\text{net}}/m = F_{g \text{ parallel}}/m = 9.8 \text{ N}/2.0 \text{ kg} = 4.9 \text{ m/s}^2$

a)  $F_N = F_{g \text{ perpendicular}} = F_g \cos \theta = 2.5 \text{ N} \cos 30 = 2.2 \text{ N}$

b)  $F_f = \mu F_N = 0.20 \times 2.2 \text{ N} = 0.43 \text{ N}$

$F_g \leftarrow$

$$F_g = 2.5 \text{ N} \sin 30^\circ + 0.43 \text{ N}$$

$F_{g11} = 1.25 \text{ N}$

$$F_g = 1.7 \text{ N}$$
